

# Maintain the Paint Protection Film

- Can be washed and waxed, like paint
  - Refrain from using colored/ pigmented waxes or waxes with abrasion.
- Do not wash vehicle for 72 hours
- Use a cleaning agent designed for high quality paint surfaces
  - The cleaning agent must be wet and nonabrasive with a pH value between 6 and 8 (neither strongly acidic nor strongly alkaline).
  - Abrasive particles will damage the film surface and result in a loss of surface quality

Consider the following points to avoid edge lifting or other damage to the film:

- Regular treatment of the surface with a polish or wax is not necessary. Do not use polish or wax with abrasive components.
- Be sure the spray nozzle includes a nozzle protector (tip guard).
- Use a maximum pressure of 80 bar.
- If the system is heated, limit the water temperature to 60°C or less.
- Hold nozzle at least 100 cm away from the film and perpendicular (90 degrees +/- 10) or a minimum of 100 cm away from the film at a 30° angle, or higher.
- Do not direct the water stream between 0°-60° to the edge of the film.
